**FOR IMMEDIATE RELEASE****HEALTH AND ENVIRONMENTAL EFFECTS OF NANOMATERIALS REMAIN UNCERTAIN;  
COHESIVE RESEARCH PLAN NEEDED TO HELP AVOID POTENTIAL RISKS FROM RAPIDLY EVOLVING TECHNOLOGY**

WASHINGTON — Despite extensive investment in nanotechnology and increasing commercialization over the last decade, insufficient understanding remains about the environmental, health, and safety aspects of nanomaterials. Without a coordinated research plan to help guide efforts to manage and avoid potential risks, the future of safe and sustainable nanotechnology is uncertain, says a new [report](#) from the National Research Council. The report presents a strategic approach for developing research and a scientific infrastructure needed to address potential health and environmental risks of nanomaterials. Its effective implementation would require sufficient management and budgetary authority to direct research across federal agencies.

Nanoscale engineering manipulates materials at the molecular level to create structures with unique and useful properties -- materials that are both very strong and very light, for example. Many of the products containing nanomaterials on the market now are for skin care and cosmetics, but nanomaterials are also increasingly being used in products ranging from medical therapies to food additives to electronics. In 2009, developers generated \$1 billion from the sale of nanomaterials, and the market for products that rely on these materials is expected to grow to \$3 trillion by 2015.

The committee that wrote the report found that over the last seven years there has been considerable effort internationally to identify research needs for the development and safe use of nanotechnology, including those of the National Nanotechnology Initiative (NNI), which coordinates U.S. federal investments in nanoscale research and development. However, there has not been sufficient linkage between research and research findings and the creation of strategies to prevent and manage any risks. For instance, little progress has been made on the effects of ingested nanomaterials on human health and other potential health and environmental effects of complex nanomaterials that are expected to enter the market over the next decade. Therefore, there is the need for a research strategy that is independent of any one stakeholder group, has human and environmental health as its primary focus, builds on past efforts, and is flexible in anticipating and adjusting to emerging challenges, the committee said.

Because the number of products containing nanoscale materials is expected to explode, and future exposure scenarios may not resemble those of today, selecting target materials to study on the basis of existing market size -- as is the practice now -- is problematic. To help guide research, the committee noted the following four research categories, which should be addressed within five years:

- identify and quantify the nanomaterials being released and the populations and environments being exposed;
- understand processes that affect both potential hazards and exposure;
- examine nanomaterial interactions in complex systems ranging from subcellular to ecosystems; and
- support an adaptive research and knowledge infrastructure for accelerating progress and providing rapid feedback to advance research.

While surveying the existing resources for research, the committee acknowledged a gap between funding and the level of activity required to support the committee's strategy. The committee concluded that any reduction in the current funding level of approximately \$120 million per year over the next five years for health and environmental risk research by federal agencies would be a setback to nanomaterials risk research. Moreover, additional modest resources from public, private, and international initiatives are needed in critical areas -- informatics, nanomaterial characterization, benchmarking nanomaterials, characterization of sources, and development of networks for supporting collaborative research -- to derive maximum strategic value from the research investments.

Implementation of the strategy should also include the integration of domestic and international participants involved in

nanotechnology-related research, including the NNI, federal agencies, the private sector, non-governmental organizations, and the academic community. The committee said that the current structure of the NNI -- which has only coordinating functions across federal agencies and no top-down budgetary or management authority to direct nanotechnology-related environmental, health, and safety research -- hinders its accountability for effective implementation. In addition, there is concern that dual and potentially conflicting roles of the NNI, such as developing and promoting nanotechnology while identifying and mitigating risks that arise from its use, impede application and evaluation of health and environmental risk research. To carry out the research strategy effectively, a clear separation of management and budgetary authority and accountability between promoting nanotechnology and assessing potential environmental and safety risks is essential.

The study was sponsored by the U.S. Environmental Protection Agency. The National Academy of Sciences, National Academy of Engineering, Institute of Medicine, and National Research Council make up the National Academies. They are independent, nonprofit institutions that provide science, technology, and health policy advice under an 1863 congressional charter. Panel members, who serve pro bono as volunteers, are chosen by the Academies for each study based on their expertise and experience and must satisfy the Academies' conflict-of-interest standards. The resulting consensus reports undergo external peer review before completion. For more information, visit <http://national-academies.org/studycommitteeprocess.pdf>. A committee roster follows.

NATIONAL RESEARCH COUNCIL  
 Division on Earth and Life Studies  
 Board on Environmental Studies and Toxicology  
 and  
 Board on Chemical Sciences and Technology

Committee to Develop a Research Strategy for Environmental, Health, and Safety Aspects of Engineered Nanomaterials

Jonathan M. Samet (chair)  
 Professor and Flora L. Thornton Chair  
 Department of Preventive Medicine  
 Keck School of Medicine, and  
 Director  
 Institute for Global Health  
 University of Southern California  
 Los Angeles

Tina Bahadori  
 Managing Director  
 Long-Range Research Initiative  
 American Chemistry Council  
 Washington, D.C.

Jurron Bradley  
 Clean Energy Market Manager  
 BASF Corp.  
 Florham Park, N.J.

Seth Coe-Sullivan  
 Co-Founder and Chief Technology Officer  
 QD Vision Inc.  
 Watertown, Mass.

Vicki L. Colvin  
 Vice Provost for Research, and  
 Professor of Chemistry and Chemical and Biomolecular Engineering  
 Rice University  
 Houston

Edward D. Crandall  
 Kenneth T. Norris Chair in Medicine

Richard A. Denison  
Hastings Professor of Medicine; and  
Chair  
Department of Medicine  
Keck School of Medicine  
University of Southern California  
Los Angeles

Richard A. Denison  
Senior Scientist  
Environmental Defense Fund  
Washington, D.C.

William H. Farland  
Senior Vice President for Research, and  
Professor  
Department of Environmental and Radiological Health Sciences  
Colorado State University  
Fort Collins

Martin Fritts  
Senior Principal Scientist  
SAIC-Frederick Inc.  
Frederick, Md.

Philip K. Hopke  
Bayard D. Clarkson Distinguished Professor  
Department of Chemical and Biomolecular Engineering, and  
Director  
Center for Air Resources Engineering and Science  
Clarkson University  
Potsdam, N.Y.

James E. Hutchison  
Lokey-Harrington Professor of Chemistry  
University of Oregon  
Eugene

Rebecca D. Klaper  
Associate Professor  
School of Freshwater Sciences  
University of Wisconsin  
Milwaukee

Gregory V. Lowry  
Professor  
Department of Civil and Environmental Engineering  
Carnegie Mellon University  
Pittsburgh

Andrew D. Maynard  
Director  
Risk Science Center  
School of Public Health  
University of Michigan  
Ann Arbor

Gunter Oberdorster  
Professor of Toxicology  
Department of Environmental Medicine  
School of Medicine and Dentistry  
University of Rochester  
Rochester, N.Y.

Kathleen M. Rest  
Executive Director  
Union of Concerned Scientists  
Cambridge, Mass.

Mark J. Utell  
Professor of Medicine and Environmental Medicine, and  
Director  
Occupational and Environmental Medicine  
School of Medicine and Dentistry  
University of Rochester

University of Rochester  
Rochester, N.Y.

David B. Warheit  
Research Fellow  
Haskell Laboratory  
E.I. du Pont de Nemours and Co.  
Newark, Del.

Mark R. Wiesner  
James L. Meriam Professor of Civil and Environmental Engineering  
Pratt School of Engineering  
Nicholas School of Environment and Earth Sciences  
Duke University  
Durham, N.C.
